Note: Determination of these conditions requires documentation by appropriate serologic testing, abnormal liver function tests, and/or abnormal liver biopsy or imaging tests. If test results are documented in the medical record, additional testing is not required.

SECTION II - MEDICAL HISTORY

2A. Describe the history (including onset and course) of the Veteran's liver condition(s) (brief summary):

SECTION III - CHRONIC LIVER DISEASE WITHOUT CIRRHOsis (INCLUDING HEPATITIS)

Note 1: Undernutrition: "Undernutrition" means a deficiency resulting from insufficient intake of one or multiple essential nutrients, or the inability of the body to absorb, utilize, or retain such nutrients. Undernutrition is characterized by failure of the body to maintain normal organ functions and healthy tissues. Signs and symptoms may include: Loss of subcutaneous tissue, edema, peripheral neuropathy, muscle wasting, weakness, abdominal distention, ascites, and Body Mass Index below normal range.

Note 2: Nutritional Support: The following describe various nutritional support methods used to treat certain digestive conditions.

(1) Total parenteral nutrition or hyperalimentation is a special liquid mixture given into the blood through an intravenous catheter. The mixture contains proteins, carbohydrates (sugars), fats, vitamins, and minerals. Total parenteral nutrition bypasses the normal digestion in the stomach and bowel.

(2) Assisted enteral nutrition requires a special liquid mixture (containing proteins, carbohydrates (sugar), fats, vitamins and minerals) to be delivered into the stomach or bowel through a flexible feeding tube. Percutaneous endoscopic gastrostomy is a type of assisted enteral nutrition in which a flexible feeding tube is inserted through the abdominal wall and into the stomach. Nasogastric or nasoenteral feeding tube is a type of assisted parenteral nutrition in which a flexible feeding tube is inserted through the nose into the stomach or bowel.

Substantial weight loss (involuntary loss greater than 20 percent of an individual's baseline weight sustained for three months with diminished quality of self-care or work tasks)

Minor weight loss (involuntary weight loss between 10 and 20 percent of an individual's baseline weight sustained for three months with gastrointestinal-related symptoms, involving diminished quality of self-care or work tasks, or decreased food intake)
